Technologies: Kotlin Multiplatform, Android, iOS, AWS (focus: Lambda, DynamoDB, SNS, SQS, Amazon Connect), React

Languages: Kotlin, Swift, Java, TypeScript, Python

EXPERIENCE

Amazon | *Last Mile Delivery Technologies*

Software Development Engineer II

Oct. 2023 - Present

- Currently building **agentic workflows** for AI automation aimed at **increasing QA and developer productivity**
- Built a backend service for automated delivery of critical notifications to delivery drivers, **reducing the P90 time to notify by 99%**
- Shipped a feature that paused work and alerted drivers to pull over and take action in light of severe safety events. **Increased compliance to safety alerts by 70%** and **enabled flexible breaks during high heat season**
- Introduced in-app incident reporting across the **iOS** and **Android** Flex apps, **increasing digital reporting by 230% and reducing safety helpline calls by 425+ per week**
- Designed a workflow with **\$1.5M in annual entitlement** that connects 4 services to detect drivers at risk of missing package pickups and alert operations management
- Pioneered the use of **Kotlin Multiplatform (KMP)** to share code in the **iOS** and **Android** Amazon Flex apps by delivering the first couple successful features to do so. **Reduced the time to deliver by 3 months** and contributed the knowledge gained to our **open source** KMP application framework project
- Drove the first of two successful features (out of 6 total attempted) to be developed with a new in-house platform for **sharing state across multiple devices via bluetooth**. Served as the **technical lead** for 5 other engineers. Owned the end to end SDLC from requirements definition to rollout. **Won the VP-level organization all-hands award for ownership**
- Authored documents with developer productivity pain points and action items that **resulted in the creation of a tiger team** to resolve longstanding build system issues and application platform gaps.
- Proposed and led the re-architecture of an anomaly-detection microservice suite that **processes 1.5 billion events per day worldwide**. Strongly defined larger service boundaries and combined the build systems and CI of **33 microservices into 13, saving 1 engineer day per week of operational load**

Software Development Engineer Intern

Jun. 2022 - Sept. 2022

- Spearheaded a proof of concept smartwatch app that will **improve the work experience for 169K+ associates at 700+ delivery stations worldwide** and results in an **80% decrease in hardware costs**
- Independently designed and created an **Android WearOS** app and integrated multiple APIs to implement Amazon credential login, **bluetooth scanner pairing** with Zebra ring scanners, and package sorting for delivery
- Coordinated across 3 teams to perform a live, on site demo to stakeholders and customers

Maxar Technologies | *DeepCore Suite*

Jun. 2021 - Dec. 2021

Software Engineering Intern

- Collaborated with 2 other interns to propose, design, and build a new feature enabling addition of custom GeoJSON layers for augmenting data visualization and analysis in a service for BYOM computer vision model inference and on large satellite images. Used **React**, **deck.gl**, **react-map-gl**, and **JavaScript**
- Took initiative when servers were down and created a mock backend with **Python** and **Flask** to enable local development

EDUCATION

University of California, San Diego

Mar. 2023

Bachelor of Science (BS) in Computer Science | GPA: 3.965/4.0

Honors: Magna Cum Laude, Phi Beta Kappa, Revelle College Honors
